Original-policy intervention: risk 1/2, recycled

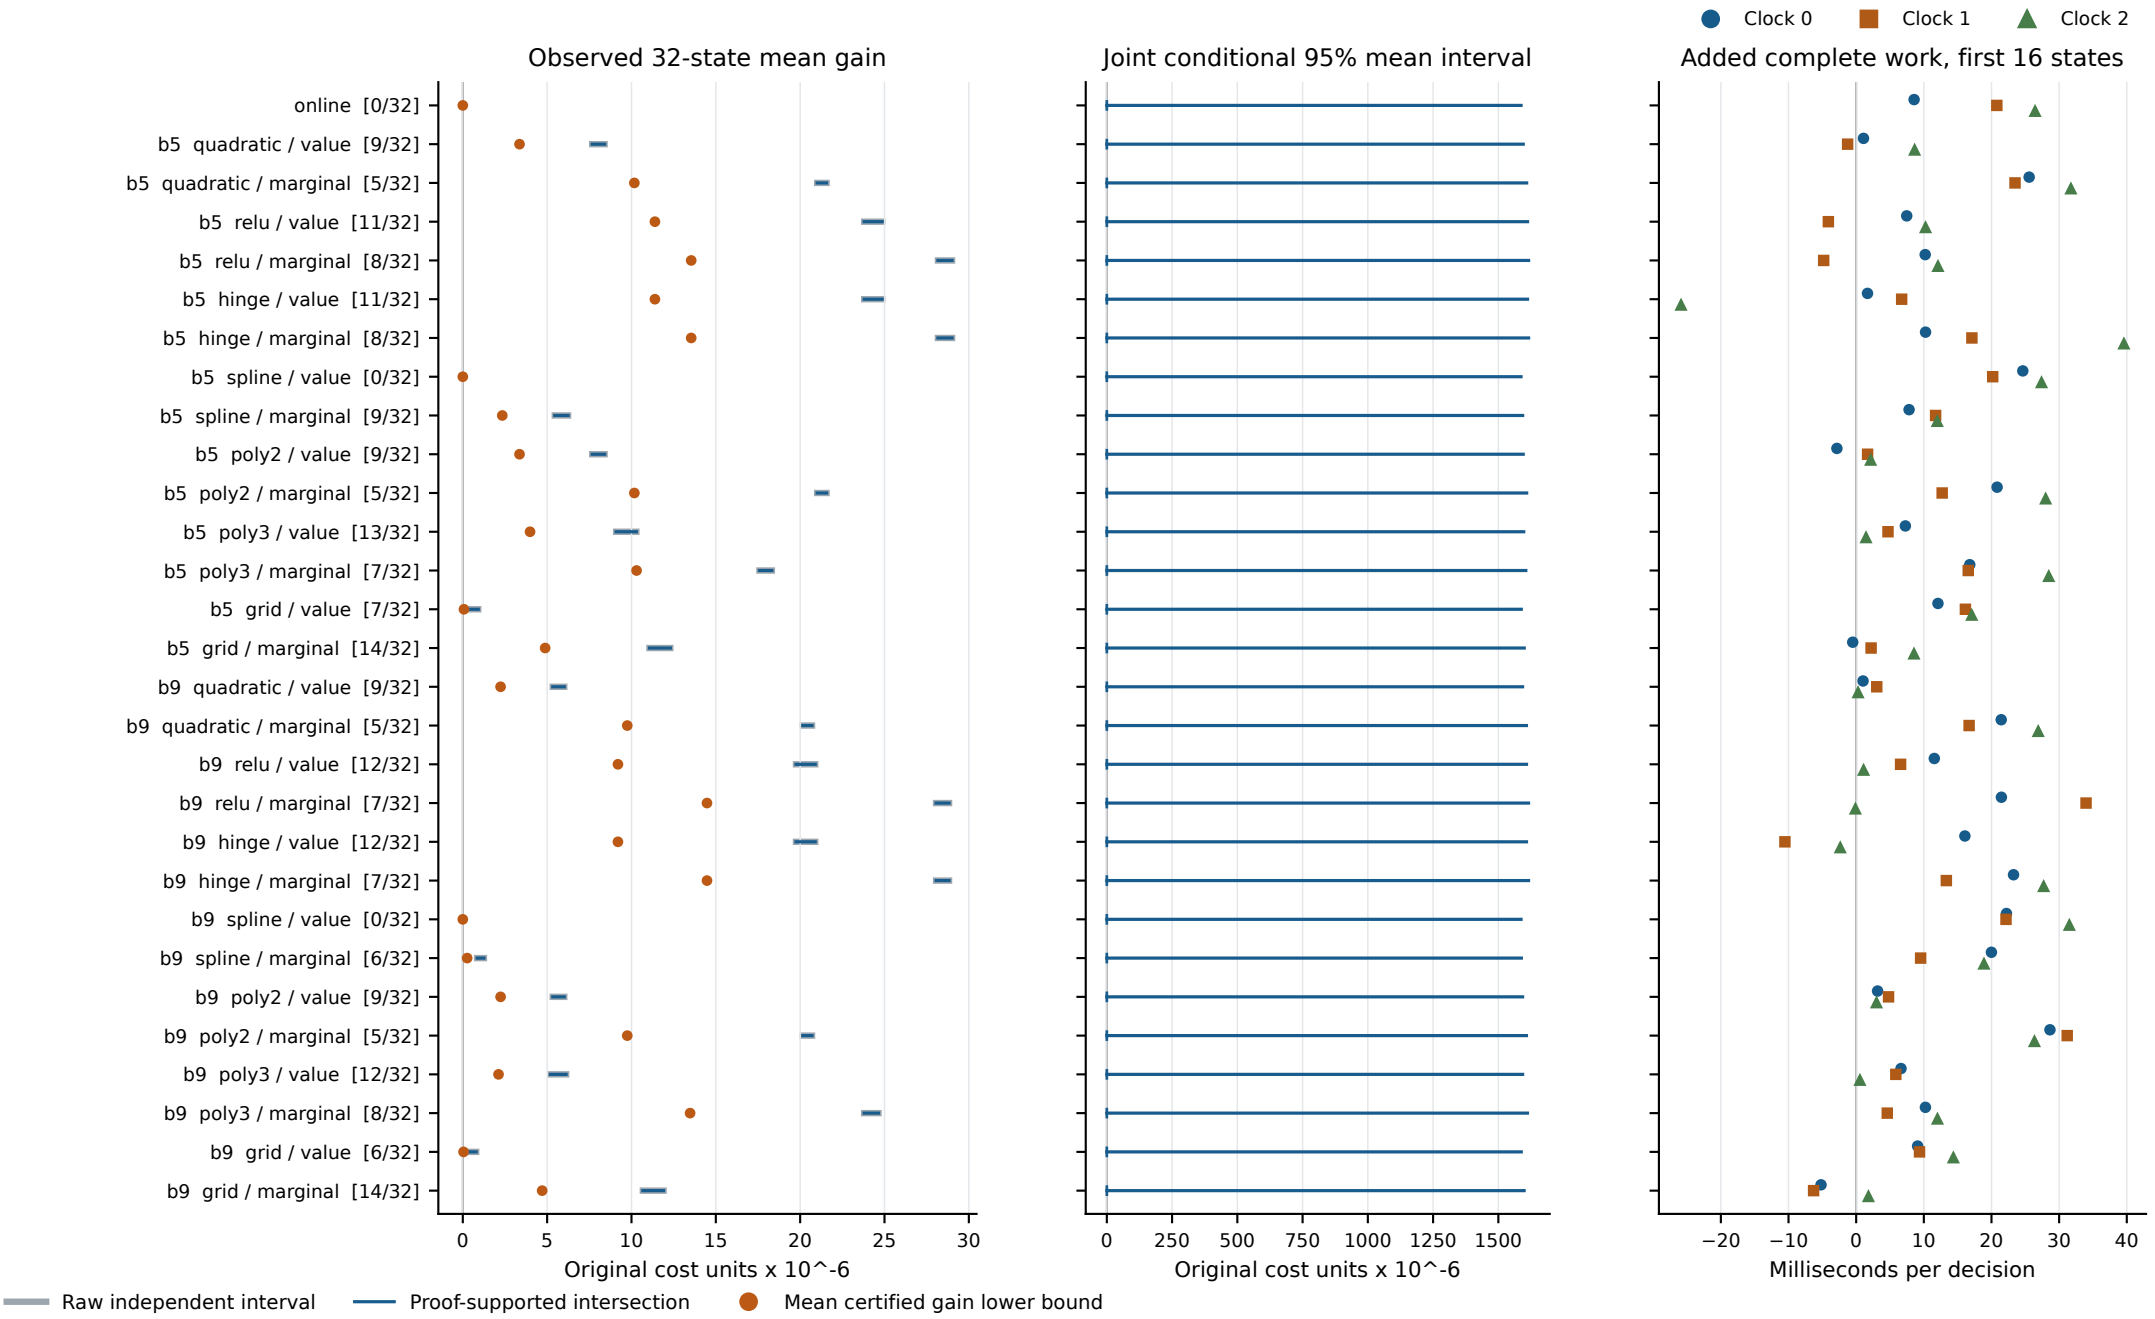

Complete fixed catalogue: 29 actors on this page; 116 contrasts across all four pages. Row order follows the frozen design.

Gain is against the same actor's completed control; [k/32] is the changed-action count. All gain columns use 32 independent initial states.
Clocks are descriptive repeated measurements on the fixed first 16 states. Full acquisition and shared costs are retained; common costs cancel only in this paired difference.
Intervals and timing differences are separate displays. They do not constitute a price-adjusted population adoption test or a neural-specific advantage claim.

Original-policy intervention: risk 1/2, adaptive

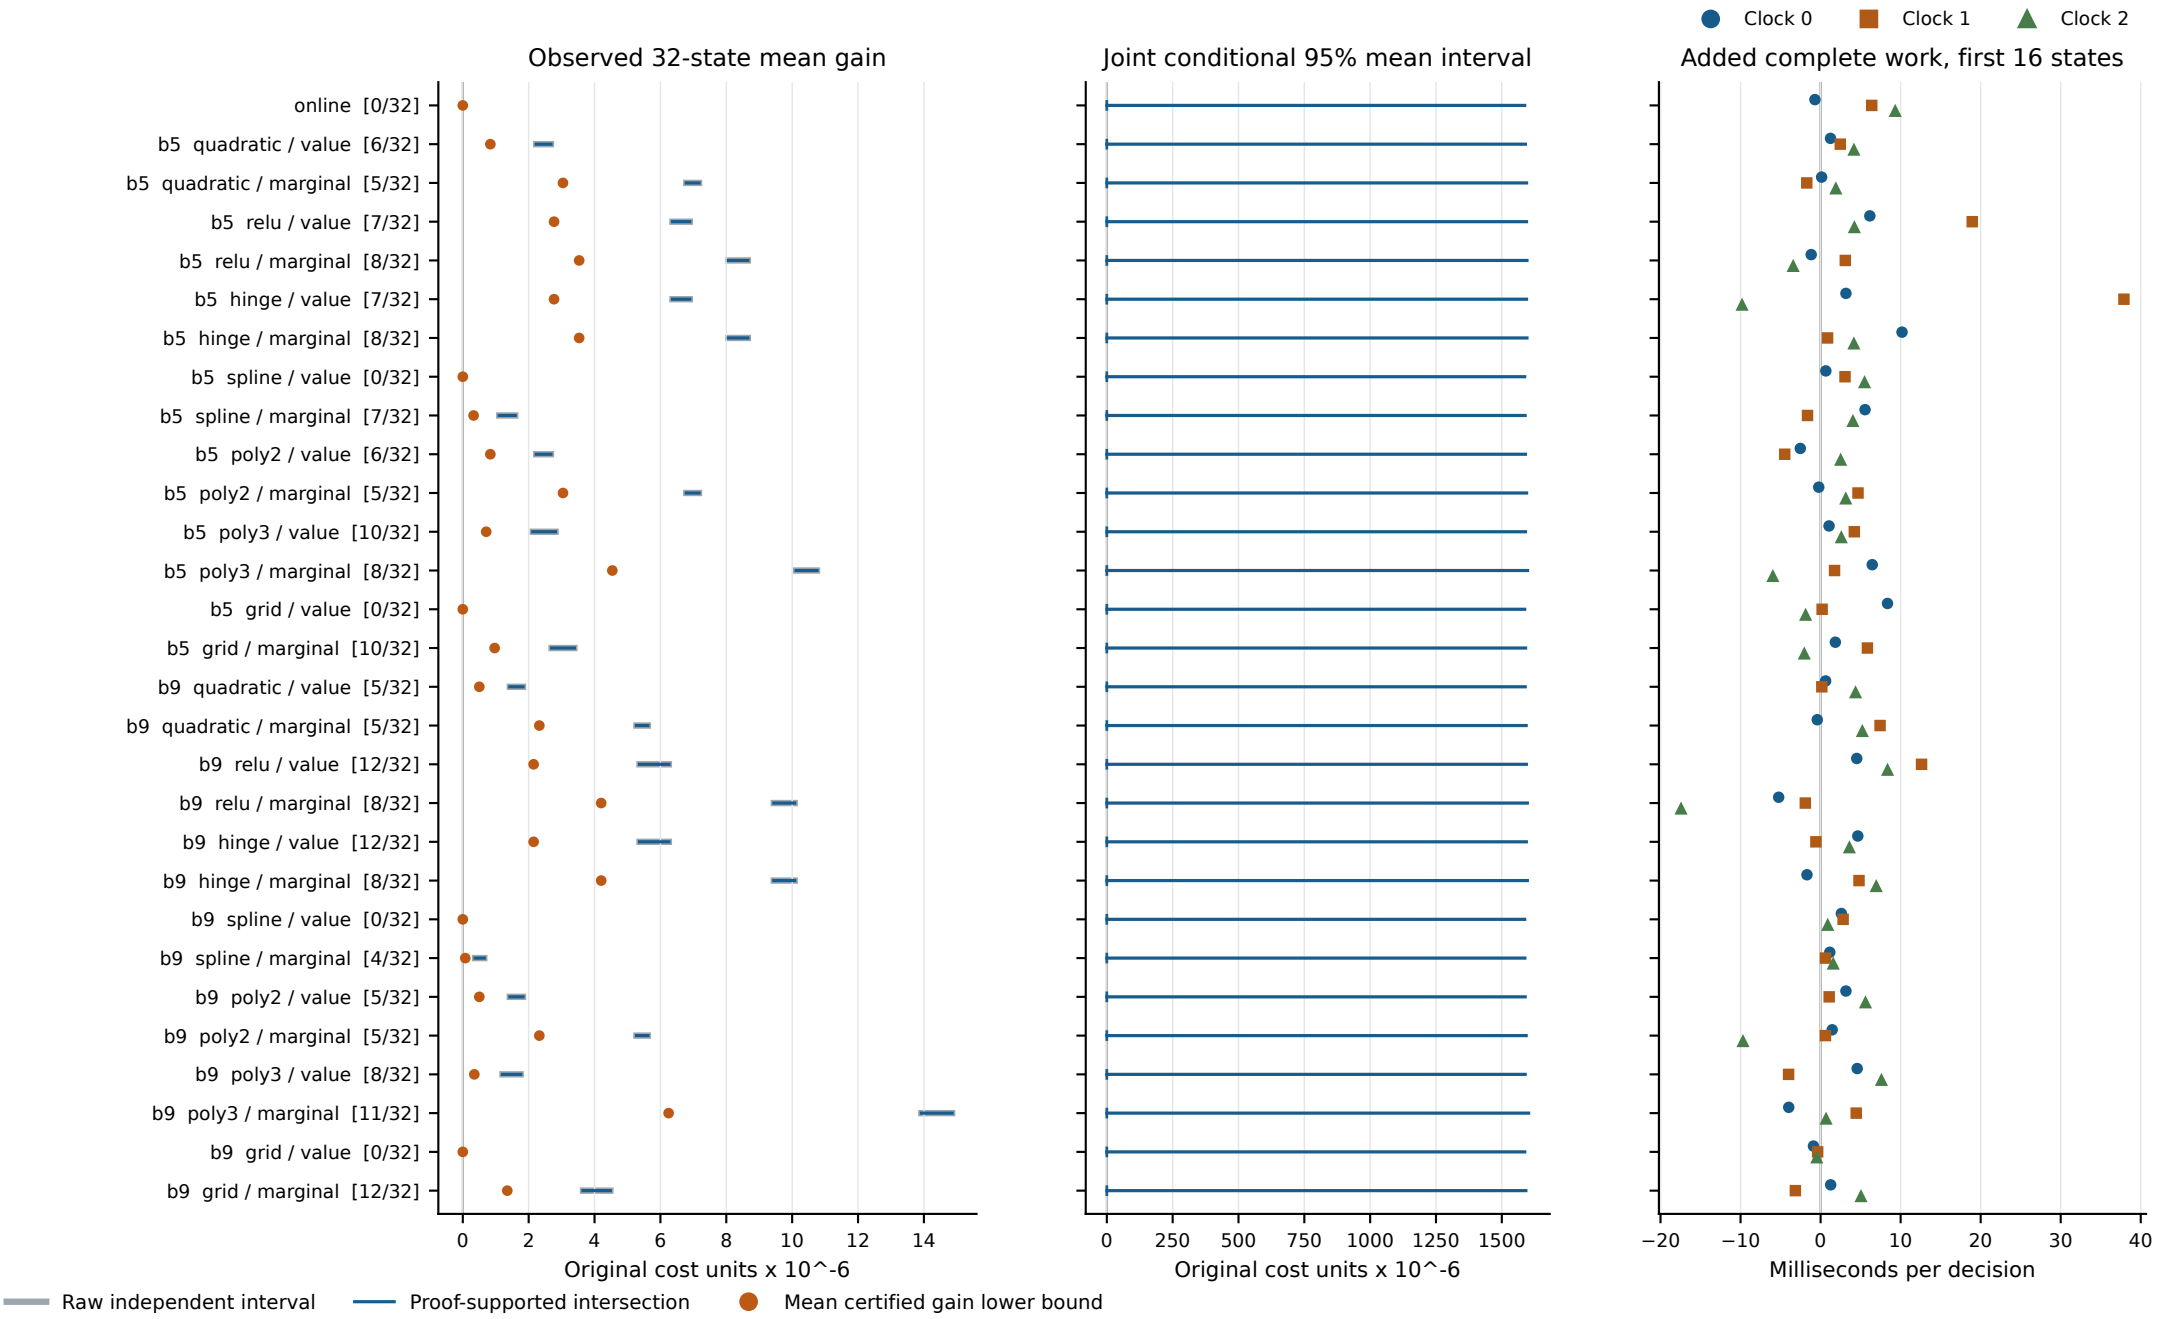

Complete fixed catalogue: 29 actors on this page; 116 contrasts across all four pages. Row order follows the frozen design.

Gain is against the same actor's completed control; [k/32] is the changed-action count. All gain columns use 32 independent initial states.
Clocks are descriptive repeated measurements on the fixed first 16 states. Full acquisition and shared costs are retained; common costs cancel only in this paired difference.
Intervals and timing differences are separate displays. They do not constitute a price-adjusted population adoption test or a neural-specific advantage claim.

Original-policy intervention: risk 3/4, recycled

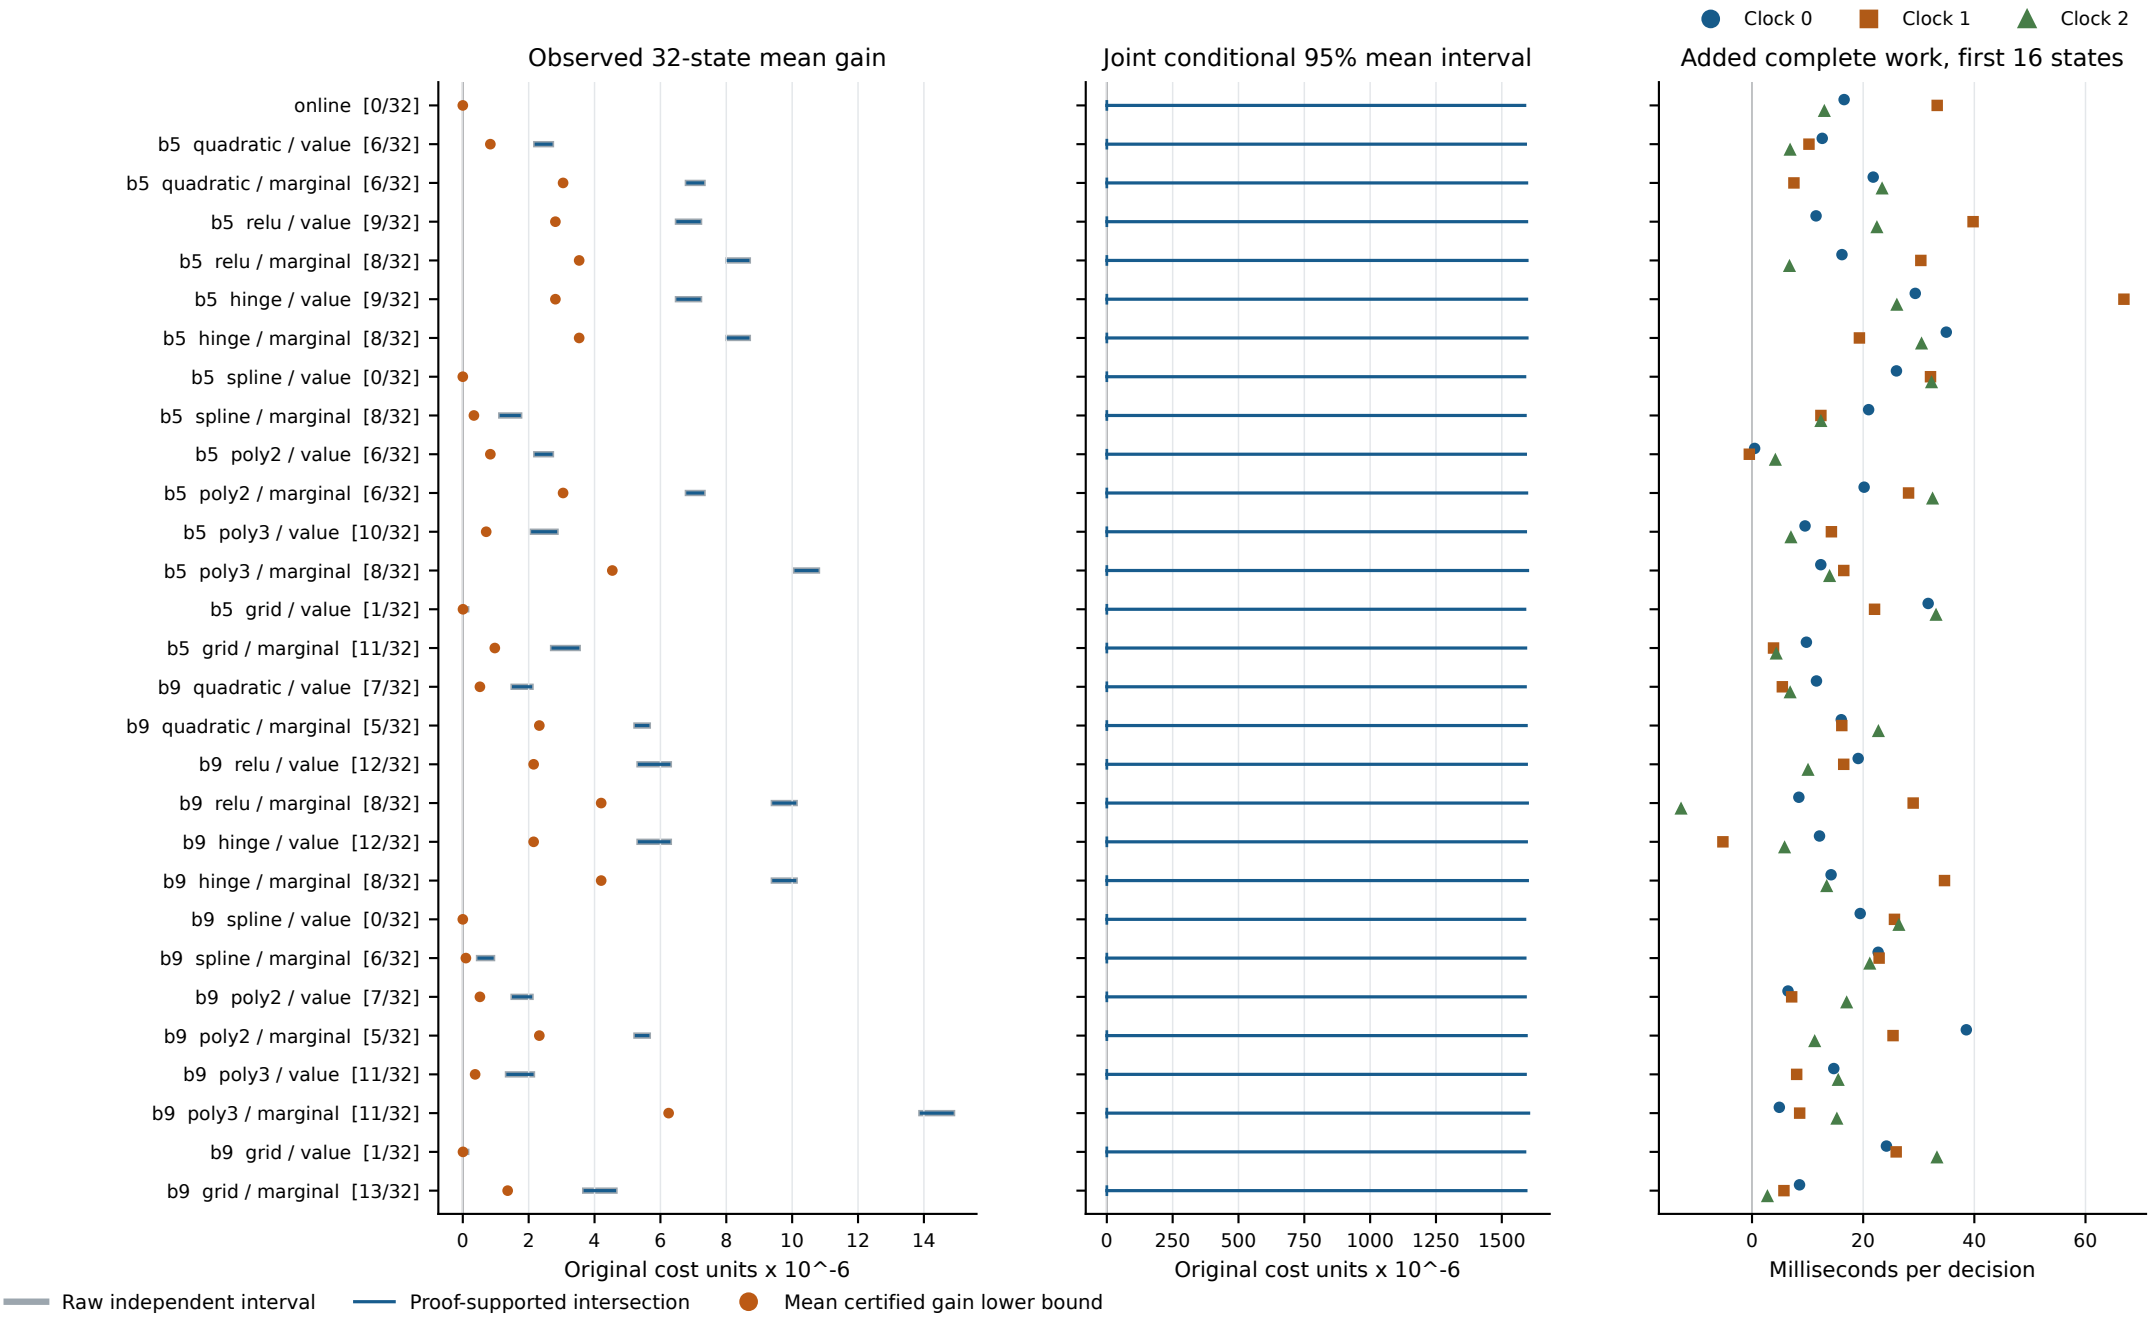

Complete fixed catalogue: 29 actors on this page; 116 contrasts across all four pages. Row order follows the frozen design.

Gain is against the same actor's completed control; [k/32] is the changed-action count. All gain columns use 32 independent initial states.
